## 1.0 INTRODUCTION

This report documents the 2006 (fifth year) monitoring results at the Kleinschmidt Creek Wetland Mitigation Site. The site was developed to mitigate wetland impacts associated with two Montana Department of Transportation (MDT) projects, Clearwater Junction North and Helmville Junction, and to serve as a reserve for future MDT projects in the watershed. Kleinschmidt Creek is located in Powell County within the Upper Clark Fork River Basin (watershed #2). The mitigation site is located approximately six miles east of Ovando, Montana and is directly adjacent to MT Highway 200 (**Figure 1**). Elevations of the site range from 4,200 ft. at the eastern boundary to 4,180 ft. at the western boundary. Land and Water Consulting (LWC) conducted the baseline wetland delineation for the Kleinschmidt Creek proposed mitigation site in the summer of 1999. A U.S. Fish and Wildlife Service contractor conducted the baseline functional assessments for the site in 1998.

The approximate site boundary is illustrated on **Figure 2** in **Appendix A**. The project is located on property owned by Thomas Rue within a 47-acre perpetual wetland conservation easement. Kleinschmidt Creek flows west until eventually draining into the North Fork of the Blackfoot River. The perennial creek is spring fed, which provides the primary hydrology source. Local groundwater systems serve as a secondary hydrology source, flowing through the deep alluvial substrate contained along Kleinschmidt Flats and eventually discharging along the Kleinschmidt Creek corridor outside and within the easement area.

Construction at the Kleinschmidt Creek Mitigation Site was completed during the summer of 2001. The overall goals of this project were the restoration, creation, and enhancement (high and low intensity) of heavily grazed and degraded creek/wetlands. Primary restoration objectives included channel reconstruction and fish habitat enhancement on approximately 5,000 ft of Kleinschmidt Creek and the creation of additional wetland areas along the spring fed corridor. Project objectives and task details are included in the following list:

### Restoration

- Narrowing and deepening the existing manipulated stream channel, restoring the portion narrowed as wetland.
- Conversion of degraded channel/open water into wetland on approximately 6 acres.
- Planting woody vegetation at a density of 500 stems per acre in portions of the site.
- Eliminating the existing stock water channel under the highway.

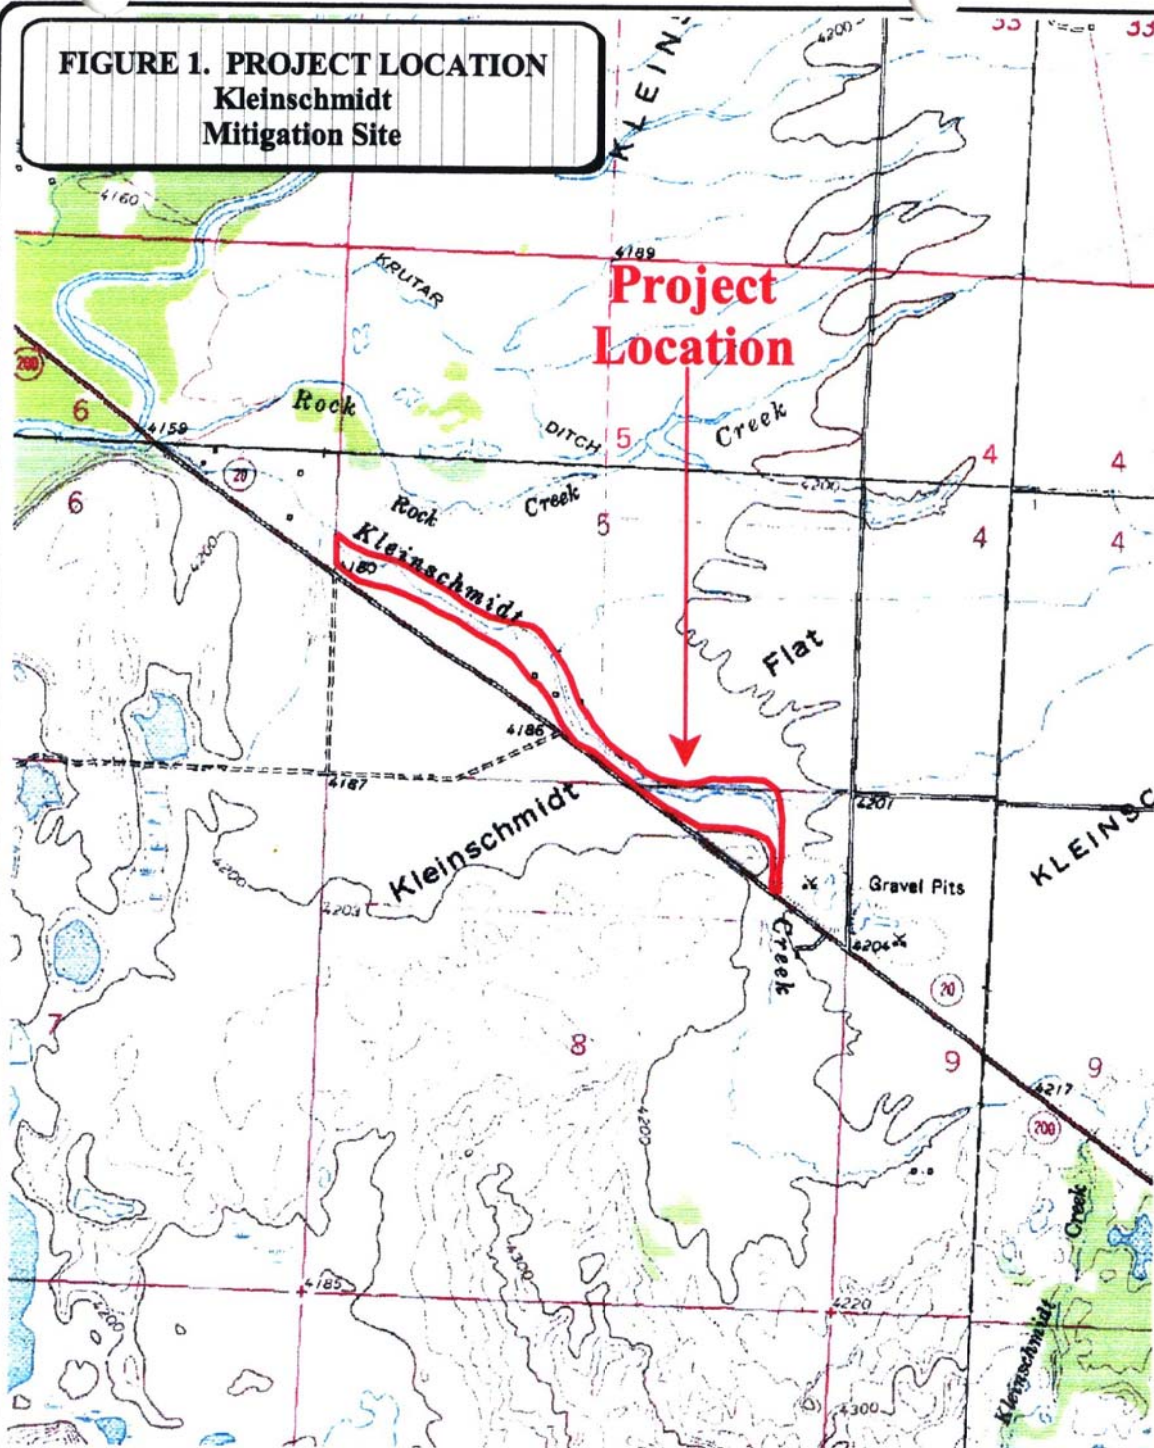

### Creation

- Converting approximately 1.19 acres of upland area to wetland / shallow open water by adjusting the surface elevation.
- Planting woody vegetation at a density of 500 stems per acre along the perimeter of the shallow open water areas.

### High Intensity Enhancement

- Planting woody vegetation on approximately 8.05 acres of existing degraded wetlands at a density of 1,500 stems per acre.

PROJECT #: 110174  
 DATE: FEB 2004  
 LOCATION:  
 PROJECT MANAGER: J. BERGLUND  
 DRAWN BY: B. STEINEBACH

**LAND & WATER CONSULTING, INC.**

1120 CEDAR PO BOX 8254 MISSOULA, MT 59807

## Low Intensity Enhancement

- Planting woody vegetation on the remaining 3.43 acres of existing degraded wetlands at a density of 500 stems per acre (clumped).

The site was designed to mitigate for specific wetland functions impacted by MDT roadway projects, including: storm water retention, roadway runoff filtration, sediment and nutrient retention, water quality, groundwater recharge, and wildlife habitat.

Mitigation credit goals and credit ratios approved by the Corps of Engineers (COE) (Steinle 2001) are contained in **Table 1**.

**Table 1: Mitigation credit goals and credit ratios for the Kleinschmidt Creek Wetland Mitigation Site.**

Project Component	Total Estimated Acres	Credit Ratio	Credit Acres
Restoration	6.0	1:1	6.0
Creation	1.19	1:1	1.19
High-Intensity Enhancement	8.05	1:2	4.02
Low-Intensity Enhancement	3.43	1:3	1.14
75-Foot Upland Buffer Preservation	12.69	1:4	3.17
<b>Total</b>	<b>31.36</b>	<b>--</b>	<b>15.52</b>

The Kleinschmidt Creek site is monitored once per year to document wetland and other biological attributes. The monitoring area is illustrated in **Figure 2** in **Appendix A**.

## 2.0 METHODS

### 2.1 Monitoring Dates and Activities

The site was visited on August 16<sup>th</sup> (mid-season) of 2006. Monitoring activities were conducted on both the “upstream” (top half of **Figures 2** and **3** in **Appendix A**) and “downstream” (bottom half of **Figures 2** and **3** in **Appendix A**) mitigation sections. The mid-season visit was conducted to document vegetation, soil, and hydrologic conditions used to map jurisdictional wetlands. All information contained on the Wetland Mitigation Site Monitoring Form (**Appendix B**) was collected at this time. Activities and information conducted/collected included: wetland delineation; wetland/open water aquatic habitat boundary mapping; vegetation community mapping; vegetation transect; soils data; hydrology data; bird and general wildlife use; macroinvertebrate sampling; GPS data points; and functional assessment.

### 2.2 Hydrology

Wetland hydrology indicators were recorded during the mid-season visit using procedures outlined in the COE 1987 Wetland Delineation Manual (Environmental Laboratory 1987). Hydrology data were recorded on COE Routine Wetland Delineation Data Forms (**Appendix B**). Additional hydrologic data were recorded on the Wetland Mitigation Site Monitoring Form (**Appendix B**). No groundwater monitoring wells were installed at the site.

Channel cross sections established on January 8, 2002 were re-sampled on December 1, 2006 (**Appendix A**).

## 2.3 Vegetation

General dominant species-based vegetation community types (e.g., *Carex/Phalaris*) were delineated on an aerial photograph during the mid-season visit. Standardized community mapping was not employed as many of these systems are geared towards climax vegetation and do not reflect yearly changes. Estimated percent cover of the dominant species in each community type was listed on the Wetland Mitigation Site Monitoring Form (**Appendix B**).

A 10-foot wide belt transect was established during the mid-season monitoring event to represent the range of current vegetation conditions. Percent cover was estimated for each vegetative species within each successive vegetative community encountered within the “belt” using the following values: T (few plants); P (1-5%); 1 (5-15%); 2 (15-25%); 3 (25-35%); 4 (35-45%); 5 (45-55%) and so on to 9 (85-95%). The transect location is illustrated on **Figure 2** in **Appendix A**. The transect is used to evaluate changes over time, especially the establishment and increase of hydrophytic vegetation. The transect location was marked on the aerial photo and all data were recorded on the mitigation site monitoring form. Transect endpoint locations were recorded with the GPS unit in 2002. A photo was taken from both ends of the transect looking along the transect path.

A comprehensive plant species list for the site was compiled and was updated as new species were encountered. Ultimately, observations from past years will be compared with new data to document vegetation changes over time. Revegetation enhancements were implemented in the spring of 2002.

Planting survival ratings and stem counts were conducted during the 2003 - 2006 monitoring seasons. Live planting totals within each mitigation type were counted using a belt transect method. The larger mitigation areas such as the restoration and high intensity enhancement zones were evaluated with more transects. One meter-wide belt transects of varying lengths were used to evaluate plantings throughout the site. The lengths of transects were based on the mitigation type being evaluated. Areas along the channel were walked in segments based on the length of the meanders and distance across wetland pads.

## 2.4 Soils

Soils were evaluated during the mid-season site visit using the hydric soils determination procedures outlined in the COE 1987 Wetland Delineation Manual. Soil data were recorded for each wetland determination point on the COE Routine Wetland Delineation Data Forms (**Appendix B**). The most current terminology used by NRCS was used to describe hydric soils (USDA 1998).

## 2.5 Wetland Delineation

Wetland delineation was conducted during the mid-season visit according to the 1987 COE Wetland Delineation Manual. Wetland and upland areas within the monitoring area were investigated for the presence of wetland hydrology, hydrophytic vegetation and hydric soils. The information was recorded on COE Routine Wetland Delineation Data Forms (**Appendix B**). The

wetland/upland boundary was originally delineated on the aerial photo during the 2002 monitoring and recorded with a resource grade GPS unit using the procedures outlined in **Appendix E**. Modifications to these boundaries in 2006 were accomplished by hand-mapping onto the 2005 aerial photograph. The wetland/upland boundary in combination with the wetland/open water boundary was used to calculate the final wetland acreage.

## **2.6 Mammals, Reptiles, and Amphibians**

Mammal, reptile, and amphibian species observations and other positive indicators of use, such as vocalizations, were recorded on the Wetland Mitigation Monitoring Form during the mid-season visit. Indirect use indicators, including tracks; scat; burrows; eggshells; skins; bones; etc., were also recorded. These observations were recorded as the observer traversed the site while conducting other required activities. Direct sampling methods, such as snap traps, live traps, and pitfall traps, were not implemented. A comprehensive species list for the entire site was compiled (**Appendix B**).

## **2.7 Birds**

Bird observations were recorded during the mid-season visit on the Wetland Mitigation Monitoring Site Form (**Appendix B**). No formal protocol, census plot, spot mapping, point count, or strip transect were conducted. Observations were recorded incidental to other monitoring activities and were categorized by species, activity code, and general habitat association.

## **2.8 Macroinvertebrates**

Macroinvertebrate samples were collected during the mid-season site visit at two locations. Samples were collected along Kleinschmidt Creek and the created pond on the upstream sections (**Figure 2 in Appendix A**). The Macroinvertebrate Sampling Protocol was used (**Appendix F**). Samples were preserved as outlined in the sampling procedure and sent to Rhithron Associates, Inc. in Missoula, Montana for analysis (**Appendix F**).

## **2.9 Functional Assessment**

A functional assessment form was completed using the 1999 MDT Montana Wetland Assessment Method (Berglund 1999) (**Appendix B**). Field data necessary for this assessment were collected during the mid-season visit.

## **2.10 Photographs**

The July 14, 2006 aerial photograph was used for **Figures 2 and 3 (Appendix A)**. Photographs were taken illustrating current land uses surrounding the site, the upland buffer, the monitored area and the vegetation transects. Each photograph point location was recorded with a resource grade GPS in 2002. The location of photo points was mapped onto **Figure 2 in Appendix A**. All photographs were taken using a digital camera during the 2003 to 2006 visits.

## 2.11 GPS Data

During the 2002 monitoring season, point data were collected with a resource grade GPS unit at the vegetation transect beginning and ending locations and at all photograph locations. Wetland boundaries were also recorded with a resource grade GPS unit in 2002, but were modified via hand mapping onto aerial photographs in 2006. Procedures used for GPS mapping and aerial photography referencing are included in **Appendix E**.

## 2.12 Maintenance Needs

Observations were made of existing structures and of erosion/sediment problems to identify maintenance needs. This did not constitute an engineering-level structural inspection, but rather a cursory examination. Current or future potential problems were documented on the monitoring form.

## 3.0 RESULTS

### 3.1 Hydrology

The main source of hydrology for this site is groundwater flowing from numerous springs that feed Kleinschmidt Creek, a perennial flowing stream that eventually drains into the North Fork of the Blackfoot River. Kleinschmidt Creek does not experience a large peak flow, which results from snowmelt. The spring fed source of hydrology at this site is augmented by the persistent movement of groundwater across the glacial outwash materials of Kleinschmidt Flats. Higher water flows are usually observed at Kleinschmidt Creek during mid summer after the groundwater levels have been recharged from snowmelt, stream flow and irrigation diversion (DNRC 1999).

The newly constructed channel consisting of rock bottom occurred on 1.75 acres within the mitigation site (**Figure 3** in **Appendix A**). Depths of the perennial creek varied, ranging from 0.5 ft in the straight segments to 2 - 5 ft deep around the bends and meanders. All other wetlands were inundated or saturated during the mid-season visit.

Channel cross sections established on January 8, 2002 were re-sampled on December 1, 2006 and the results are presented on **Figure 5** in **Appendix A**. Banks have remained stable since construction and lateral channel migration has not been observed. As Kleinschmidt Creek is a spring creek with a stable hydrologic regime, major channel adjustments were not anticipated and have not been observed to date.

### 3.2 Vegetation

Seventy-seven plant species were identified at the site and are listed in **Table 2**. The majority of these species are herbaceous, occurring in saturated wetland meadow complexes and the constructed wetland pads along the reconstructed channel. These wet meadows are seasonally inundated from a ground water-fed hydrology source. A few small groups of mature Pacific willow (*Salix lasiandra*) are present and are limited in distribution to near the heads of the springs. Also, a few random Bebb's willow (*Salix bebbiana*) and shrubby potentilla

<sup>1</sup> **Bolded** species indicate those documented in the analysis area for the first time in 2006.

(*Potentilla fruticosa*) occur throughout some of the wet meadow complexes, but for the most part are very limited in distribution due to the historic livestock grazing.

Nine wetland and four upland community types were identified and mapped at the mitigation site (**Figure 3 in Appendix A**). The nine wetland community types include Type 3:

*Phleum/Agrostis*, Type 4: *Juncus/Carex*, Type 5: *Phalaris/Agrostis*, Type 6: *Juncus/Agrostis*, Type 7: *Carex/Juncus*, Type 9: *Salix*, Type 10: *Salix/Alnus*, Type 12: *Phalaris/Typha* and Type 13: *Ranunculus/Juncus*. The four upland community types include Type 1:

*Medicago/Centaurea*, Type 2: *Phleum/Melilotus* and Type 8: *Centaurea/Carduus* and Type 11: *Bromus/Phleum*. Plant species observed within each of these communities are listed on the **COE Forms (Appendix B)**.

Wetland types 4, 9, and 10 were present before reconstruction of the channel. Pre-construction wetland delineation mapped the majority of the site as emergent wetlands. Type 4 is a remnant wetland with heavy past alterations due to livestock grazing. Type 4 occurs in saturated to shallow water conditions. Vegetation is dominated by Baltic rush (*Juncus balticus*) and Nebraska sedge (*Carex nebrascensis*). During the 2005 monitoring, Crawe sedge (*Carex crawei*), rated S2 by the Montana Natural Heritage Program, and green-keeled cottongrass (*Eriophorum viridicarinarum*), formerly rated as S3, were identified in this type. Type 9 consists of a small

group of several mature Pacific willows found near the heads of the larger springs located near the east end of the site. Type 10 is located along the upper most reaches of the mitigation site; vegetation is dominated by Bebb's willow and thin leaved alder (*Alnus incana*) with a herbaceous layer of wetter grass species such as reed canarygrass (*Phalaris arundinacea*) and redtop (*Agrostis alba*). The remaining wetland types were created during the channel reconstruction and wetland creation. Community Type 3: *Phleum/Agrostis*, formerly located in the upstream section of the project around the shallow water fringes of the excavated wetland, was replaced by Community Type 12 during 2005. Community Type 12 is dominated by reed canarygrass, cattails and aquatic vegetation. Community Type 5 is located within the reconstructed channel and adjacent created wetland pads. Type 5 includes the vegetation along the streambanks that were lined with transplanted wetland sod from within the site. Streambank vegetation is dominated by the transplanted Baltic rush and Nebraska sedge that was removed from within Community Type 4. The streambank and adjacent wetlands were sprigged with several willow species and also planted with variety of 10T cubic inch seedlings (**Appendix G**).

The remaining area of Type 5 includes the created wetland pads dominated by reed canarygrass, dagger-leaved rush (*Juncus ensifolius*) and redtop. During the 2002 monitoring these created wetlands had minor distributions of some invasive species such as lambs quarter (*Chenopodium album*), white campion (*Lychnis alba*), spotted knapweed (*Centaurea maculosa*) and Canada thistle (*Cirsium arvense*). Observations during the 2006 season showed little evidence of these invasive species being present. It is possible that extended late season inundation and high groundwater table ultimately drowned out the invasive species and also was a more suitable water regime for the development of wetland species that now occupy these niches. The site is dominated by the aggressive reed canarygrass. The potential exists for this species to eventually dominate the entire wetland pads and ultimately decrease the high diversity of wetland grasses and forbs present on the site.

Community Type 6 is located around the fringe of excavated wetland on the lower, downstream section of the mitigation site. Vegetation surrounding the excavated wetland fringe is dominated by dagger leaf rush, redtop and nodding beggars-ticks (*Bidens cernua*). Community Type 13 was added during the 2005 monitoring. Areas considered as open water within the smaller excavated wetland were mapped as shallow water with emergent and aquatic bed vegetation types. The shallow waters are dominated by whitewater buttercup (*Ranunculus aquatilis* var. *hispidulus*) and other aquatic vegetation. The remaining wetland Community Type 7, which also is located exclusively within the downstream reach of the mitigation site, is dominated by Nebraska sedge and dagger leaf rush.

Extensive revegetation efforts to re-establish woody plant species were implemented during 2001 and 2002 seasons. Revegetation included planting of 10T cubic inch seedlings and sprigging of willows in community types 2, 3, 4, 5, 6, 7 and 12. Larger, more mature shrubs were transplanted along the channel banks in Community 5. Refer to **Sections 3.9** and **3.10** and **Appendix G** for specific details on revegetation.

Pasture crops and non-native grass species mainly dominate adjacent upland vegetation communities. Type 1 consists of an alfalfa field with a minor infestation of spotted knapweed. Alfalfa is still being cultivated and hayed for livestock feed. Type 2 is located within the upstream section of the mitigation project adjacent to Type 1 and excavated wetlands. This community type on the south and eastern fringes of the excavated wetlands consists of mostly upland species, but also was planted with a variety of woody-stemmed plants (**Appendix G**).

Type 8 is an upland community type located in the downstream section near the western end of the mitigation site. Type 8 is located along two cut slopes of an old rail grade that historically crossed this lower section of the mitigation site. These dry slopes are outside the saturated zone of the wetland area and are dominated by several aggressive invasive and noxious weed species. Type 8 is dominated by spotted knapweed and musk thistle (*Carduus nutans*). Type 8 populations of musk thistle continue to expand per year, and no evidence of weed control was observed within this area. The remaining upland community, Type 11, covers the majority of the upland areas. Type 11 is dominated by mostly non-native grasses used for livestock grazing. Type 11 is found on the outer fringes of the wetland corridor in both the upstream and downstream sections.

Several Category 1 Noxious weeds were observed throughout the Kleinschmidt Creek Mitigation Site. These plants include spotted knapweed, Canada thistle, hounds tongue (*Cynoglossum officinale*) and Oxeye daisy (*Chrysanthemum leucanthemum*). Other invasive or non-native species include common dandelion (*Taraxacum officinale*), lambsquarter, clasping pepper-grass (*Lepidium perfoliatum*), butter and eggs (*Linaria vulgaris*), black henbane (*Hyoscyamus niger*), musk thistle, pennycress (*Thlaspi arvense*), tall tumbleweed mustard (*Sisymbrium altissimum*) and quackgrass (*Agropyron repens*).

Vegetation transect results are detailed in the attached data forms and are graphically summarized in **Charts 1** and **2**. A tabular transect summary is presented in **Table 3**.

**Table 3: Transect 1 data summary for 2002 – 2006.**

Monitoring Year	2002-2003	2004	2005	2006

**Chart 2: *Length of vegetation communities along Transect 1 for each year monitored.***

### 3.3 Soils

The soils located at the Kleinschmidt Creek site are mapped as Tetonview Loam and Perma Gravelly Loam (NRCS 2004). Tetonview Loam is listed on the Powell County Hydric Soils list and covers a majority of the mitigation site. These soils have a 0 to 4 percent slope and are classified as a stream terrace type landform with alluvial parent materials. The majority of the site was mapped as the Tetonview loam, which includes all of the upstream sections and a portion of the downstream sections. The remaining downstream section includes Perma Gravelly Loam. These soils have 8 to 15 percent slopes and are classified as an alluvial fan type landform with parent materials consisting of alluvium. Perma Gravelly loam is considered somewhat excessively drained. Soil profiles examined during monitoring visits revealed similar soil types to those mapped in this area. Wetland soils observed during monitoring and documented on the COE Routine Wetland Delineation Data Form were mostly peat, loams, or clays with very low chromas (1 or 2). Mottles were present in one profile. Soil profiles in the grass and sedge-dominated areas mostly consisted of deep A horizons of peat or mucky mineral textured materials with an underlying clay layer.

### 3.4 Wetland Delineation

Delineated wetland boundaries are illustrated on **Figure 3** in **Appendix A**. Completed wetland delineation forms are included in **Appendix B**. Soils, vegetation, and hydrology are discussed in preceding sections. The 1999 pre-construction wetland delineation documented 13.78 acres of wetland and 7.59 acres of over-excavated open water channel on the mitigation site (**Table 4**; **Figure 4** in **Appendix A**). Wetland conditions identified in 1999 and from 2002 to 2006 monitoring are presented in **Table 4**.

**Table 4: Wetland conditions within the Kleinschmidt Creek Wetland Mitigation Site.**

Condition	2006 (acre)	2005 (acre)	2004 (acre)	2002-2003 (acre)	Pre-Project 1999 (acre)
Gross Wetland Area	25.41	25.25	25.25	25.99	21.38
Open Water Area	2.41	2.43	2.72	2.6	7.59
<b>Net Wetland Area</b>	<b>23.00</b>	<b>22.82</b>	<b>22.53</b>	<b>23.30</b>	<b>13.78</b>

Approximately 23 wetland acres and 2.41 restored channel/open water acres are currently within the monitoring area (**Figure 3** in **Appendix A**). The pre-construction wetland delineation reported 13.78 wetland and 7.59 over-excavated open water channel acres. The net increase in gross wetland acres for 2006 was  $23 - 13.78 = 9.22$  acres, while the open water of 7.59 (degraded channel) acres decreased to 2.41 acres, consisting of restored sinuous stream channel (1.75 acres) and portions of one excavated shallow wetland (0.66 acre).

Differences between pre-and post-project net wetlands were due to the decrease in degraded channel/open-water, active restoration of wetlands, addition of two excavated shallow wetland areas that were created in upland areas, and “passive”, or incidental, wetland restoration. Incidental wetland restoration occurred outside of enhancement areas within portions of intended upland buffer areas.

### 3.5 Wildlife

Wildlife species and evidence of wildlife, observed on the site during the 2002 to 2006 monitoring visits are listed in **Table 5**. Specific evidence observed, as well as activity codes pertaining to birds, is provided on the completed **Monitoring Form** in **Appendix B**.

**Table 5: 2002-2006 fish and wildlife species observed at the Kleinschmidt Creek Wetland Mitigation Site.**

<b>FISH</b>  Westslope Cutthroat Trout ( <i>Oncorhynchus clarki lewisi</i> ) <b>Brook Trout (<i>Salvelinus fontinalis</i>)<sup>1</sup></b> <b>Brown Trout (<i>Salmo trutta linnaeus</i>)<sup>1</sup></b> Bull Trout ( <i>Salvelinus confluentus</i> ) Rainbow ( <i>Oncorhynchus mykiss</i> ) <b>Sculpins (<i>Cottus spp.</i>)<sup>1</sup></b>
<b>AMPHIBIANS</b>  <b>Spotted Frog (<i>Rana luteiventris</i>)</b>
<b>REPTILES</b>  None

<b>MAMMALS</b>  Coyote ( <i>Canis latrans</i> ) <b>Deer (<i>Odocoileus sp.</i>)</b> Elk ( <i>Cervus elaphus</i> )

**Bolded** species were observed during 2006 monitoring.

<sup>1</sup> Species identified in 2006 by Montana Fish Wildlife & Parks Blackfoot Tributary Fisheries Survey.

<sup>2</sup> Observed by MDT in 2006.

This site provides habitat for a variety of wildlife species, although this was not necessarily reflected in the 2002 - 2006 monitoring data. Indications of one mammal, one amphibian, and two bird species were noted at the mitigation site during the 2006 site visits, with additional observations by MDT staff (**Table 5**). Deer frequent the site and occasionally the property owner has observed elk on the site. Deer are thought to be partially responsible for browse

disturbance to planted woody vegetation, although livestock broke into a portion of the site in 2004.

The newly constructed channel offers habitat for three types of fish species. These species include low numbers of brook trout, brown trout and sculpins (FWP 2006). Final survey results not yet available. The Montana Department of Fish, Wildlife and Parks conducted pre-project and post-project surveys during 1998, 2000, 2003, 2004, and 2006.

### 3.6 Macroinvertebrates

Complete 2006 results from the macroinvertebrate sampling locations (**Figure 2 in Appendix A**) are presented in **Appendix F**. Two points were sampled at this mitigation site during 2006. The two 2006 sampling locations are along the creek and pond on the upstream section of the site. There was a decline in the stream bioassessment score between the years 2004 and 2006; however, the reason for this decline is not clear. In this spring-fed system, the banks and bed are extremely stable through the site (e.g., no sediment concerns), indicating that the decline may be related to an unidentified upstream water quality problem. The following macroinvertebrate analysis was provided by Rhithron Associates, Inc. (Bollman 2006).

#### Shallow Open Water – 2006

*Bioassessment index scores remained relatively stable between 2005 and 2006, despite a loss of taxa richness. POET taxa richness was high in each year of the study. Assemblage sensitivity as measured by the biotic index value indicated good water quality at this site. A single mayfly taxon (*Callibaetis* sp.) was collected, but it was abundant. The dominant taxon was the amphipod *Hyaella* sp., which suggests that senescent macrophytes provided both habitat and an energy source for invertebrates here. Sub-optimal conditions are indicated.*

#### Stream - 2006

*Both lentic and lotic flow conditions were evident at the stream site; many taxa collected here were rheophilic. The Montana DEQ bioassessment index for Valley and Foothill Prairie streams indicates severe impairment at this site. Metric indicators of water quality gave conflicting results, although no mayfly taxa were collected, the biotic index value was low. Midges, especially *Tanytarsus* sp. and *Orthocladius* sp. dominated the sample. These taxa suggest the presence of filamentous algae.*

**Chart 3: Bioassessment scores for Kleinschmidt Creek Wetland Mitigation Site.**

### 3.7 Functional Assessment

Functional Assessment Forms were completed for wetlands in 2006 (**Appendix B**). The two assessment areas (AAs) evaluated at Kleinschmidt Creek were separated into channel corridor/wetlands (23.86 acres) and excavated wetlands (1.55 acres) and rated as Category II (high value) and Category III (moderate value), respectively.

The channel corridor/wetland area received moderate to high ratings for threatened and endangered (T&E) species habitat, Montana Natural Heritage Program (MTNHP) species habitat, surface water storage, production export/food chain support and groundwater discharge/recharge. The variable for T&E species habitat rated moderate due to documented secondary bull trout (*Salvelinus confluentus*) habitat in the project area (FWP 2003). The variable for MTNHP species habitat rated high due to the identification in 2005 of an S2 plant species, Crawe sedge. A formerly-listed S3 species, green-keeled cottongrass, was also noted. Also contributing to this higher rating was the presence of secondary habitat for westslope cutthroat trout (*Oncorhynchus clarki lewisi*) based on Montana Fish, Wildlife & Parks (MFWP) surveys in 2003. The surface water storage variable rated high due to the acre-feet of water contained within the channel and adjacent wetlands. The site received a high sediment/shoreline stabilization rating due to the dominant percent cover of sedges and rushes with deep binding roots along the channel. Willow sprigged along the banks will also develop into larger, more robust shrubs with extensive deep binding roots systems.

The Category III rating for excavated wetlands was primarily due to low ratings for T&E species habitat and MHNHP species habitat, and uniqueness. General wildlife habitat, sediment/shoreline stabilization, sediment/nutrient removal and production export rated as moderate. Other factors contributing to this score were high ratings for surface water storage and groundwater discharge/recharge.

Based on functional assessment results (**Table 6**), approximately 212 functional units occur at the Kleinschmidt Creek mitigation site. Baseline functional assessment results are also provided in **Table 6** for general comparative purposes. However, it should be noted that direct comparison between the baseline and 2002 - 2006 functional assessments is not possible as they were completed using different versions of the MDT functional assessment methods. The baseline assessment was completed using the 1997 version, while the 2002 - 2006 assessments were conducted using the most current (1999) version. Nonetheless, functional units appear to have generally doubled at the site since construction.

### 3.8 Photographs

Representative photographs were taken from photo-points and transect ends (**Appendix C**).

### 3.9 Revegetation

Upon completion of the new channel, adjacent wetlands, and excavated wetlands, revegetation efforts were conducted to enhance riparian habitat throughout the mitigation site. Approximately 6,000 willow cuttings were sprigged and 12,800 10 cubic inch container woody shrub/tree seedlings were planted throughout the entire site in the varying mitigation work areas. Planting quantities and locations were based on a stem per acre requirement for each type of mitigation work. **Table 7** describes the type of mitigation work and stems per acre requirement.

Table 6: Summary of 1998 (baseline) and 2002 to 2006 wetland function/value ratings and functional points at the Kleinschmidt Creek Wetland Mitigation Project.<sup>1</sup>

<sup>1</sup> The baseline assessment was performed using the 1997 MDT Assessment Method. Several parameters were substantially revised in the 1999 MDT Assessment Method, which was used to evaluate 2002 - 2006 monitoring conditions. Thus, direct comparison of pre- and post-project functions is not possible; although, some general trends can be noted.

<sup>2</sup> See completed 2006 MDT functional assessment forms **Appendix B** for further detail.

<sup>3</sup> Assessment completed as indicated by Montana Department of Transportation (MDT), U.S. Fish & Wildlife Service (USFWS), or Post, Buckley, Schuh, and Jernigan (PBSJ), formally Land & Water Consulting (LWC).

**Table 7: Type of mitigation work and required stems per acre for the Kleinschmidt Creek Wetland Mitigation Site.**

Type of Mitigation Work	Planting Area	Required Stems per Acre for Credit <sup>1</sup>
Restoration	Channel, streambank, and wetland pads	500
Creation	Fringes around shallow open water	500 <sup>2</sup>
High-intensity enhancement	Emergent wetlands	1,000
Low-intensity enhancement	Emergent wetlands	500

<sup>1</sup> As presented in LWC (2001) and confirmed in Steinle (2001); <sup>2</sup> Not specifically stated as success criterion in LWC (2001).

Twelve species were planted at this mitigation site (**Table 8**). Species selection was based on observation of similar wetlands in the Ovando area and species historically known to occur in this region. Refer to **Appendix G** for a list of species and their associated quantities.

**Table 8: Planted species at Kleinschmidt Creek Wetland Mitigation Site.**

Common Name	Scientific Name
aspen	<i>Populus tremuloides</i>
alder	<i>Alnus incana</i>
black cottonwood	<i>Populus trichocarpa</i>
dogwood	<i>Cornus stolonifera</i>
bog birch	<i>Betula glandulosa</i>
Booths willow	<i>Salix boothii</i>
yellow willow	<i>Salix lutea</i>
Geyer willow	<i>Salix geyeriana</i>
Bebb willow	<i>Salix bebbiana</i>
Drummonds willow	<i>Salix drummondiana</i>
hawthorn	<i>Crataegus douglasii</i>
woods rose	<i>Rosa woodsii</i>

### 3.10 Woody Species Survival and Performance Success

Results from the belt transects were calculated using extrapolated stem densities. The results from the belt transect evaluations for each mitigation type are presented in **Table 9**. The “percent of 1 acre” figures listed in **Table 9** are based on a combined total for all transects walked for each mitigation type. **Table 9** also lists the area sampled (square feet) for each type and the total number of actual stems counted within the transects. Individual species survival is not listed; counts are based on the number of live stems present within each mitigation type.

**Table 9: Stem density count for each mitigation type for the Kleinschmidt Creek Wetland Mitigation Site.**

Year	Creation (perimeter)			Restoration (throughout)			High Intensity Enhancement (throughout)			Low Intensity Enhancement (throughout)		
	Sq. Ft.	% of Acre	# of Stems	Sq. Ft.	% of Acre	# of Stems	Sq. Ft.	% of Acre	# of Stems	Sq. Ft.	% of Acre	# of Stems
<b>2006</b>	3,396	8	109	6,395	15	212	3,168	7	153	1,040	2	46
<b>2005</b>	2,495	6	108	3,614	8	256	3,218	7	254	426	1	21
<b>2004</b>	2,610	6	173	4,396	10	343	4,623	10.61	221	0	0	0
<b>2002-2003</b>	1,554	3.57	58	5,900	13.55	311	6,079	13.95	354	792	1.82	48

During 2003, a small number of transects were evaluated in the low intensity area due to lack of available woody vegetation to evaluate. These areas had been planted during the initial revegetation efforts, but were later disturbed by intensive livestock grazing. During the 2004 monitoring, no woody plants were observed in this low intensity area, and the results represent these findings. During the 2006 monitoring a few woody plants were located. The low intensity site still lacks significant amounts of woody plants, except for a few larger transplanted shrubs.

Ultimately, the cover of woody species throughout the site can be estimated based on transect data. **Table 10** lists the estimated number of stems per acre based purely on the extrapolation of sampled transect count data to the larger treatment areas. These figures likely over-estimate stem density as planting locations and densities were often concentrated (clumped), rather than uniformly distributed across the various treatment areas. Woody plantings were distributed in clumps of varying size, and in some instances were planted at a higher density in locations that were more accessible. Areas such as the restored pads were covered with an even distribution of clump plantings across the entire area. Plantings in the high intensity enhancement areas were more sporadic and concentrated in locations with bare ground or areas with scalped sod.

Preliminary results for 2006 show a decreased stem density for all the mitigation areas, except the low intensity zones. Stem density numbers varied between monitoring years for several reasons, including variability in transect locations and increased sampling area for the creation, restoration and low intensity zones.

**Table 10: *Extrapolated woody stem densities for each mitigation zone at the Kleinschmidt Wetland Mitigation Site.***

Mitigation Zone	2003 Estimated Density Per Acre	2004 Estimated Density Per Acre	2005 Estimated Density Per Acre	2006 Estimated Density Per Acre	Target Stem Density Per Acre
<b>Creation</b>	1,625	2,883	1,800	1,363	500 (along perimeter)
<b>Restoration</b>	2,295	3,430	3,200	1,413	500 (throughout)
<b>High Intensity Enhancement</b>	2,537	2,083	3,629	2,185	1,000 (throughout)
<b>Low Intensity Enhancement</b>	2,637	0	2,100	2,300	500 (throughout)

Current methods for stem density calculation are likely over-estimating actual stem densities at the site. However, as these estimates are currently three times greater than the performance requirements in creation and restoration areas and two times greater than the performance requirement in the high-intensity enhancement areas, the 2006 stem densities are likely still meeting the target density agreed to by the Army Corps of Engineers (LWC 2001) for all categories except low intensity enhancement. The estimated stem count for the low-intensity area is likely exaggerated. Woody stems counted in this area were recorded from a single location that most likely received less grazing pressure than the other areas of the low-intensity enhancement area.

### **3.11 Maintenance Needs/Recommendations**

Although the landowner treated weeds near upper excavated shallow open water area and other areas in 2004, several noxious weeds are present including Canada thistle, hounds tongue, oxeye daisy and spotted knapweed, which should be controlled. The continued spread of noxious weeds within the dry portion of upland areas within the mitigation area was recorded with an increase in knapweed along the lower section of the project in Community Type 11.

To achieve credit in the low intensity sections, the areas impacted by livestock grazing should be revegetated with woody plants. Areas outside the perimeter of the excavated wetlands, which are currently dominated by mostly invasive species, could be treated via mechanical and cultural weed control activities to control invasive species. These include mowing or hand whipping of taller weed species and seeding of bare ground with an appropriate mix suited for the hydrological regime. Mechanical weed control would be recommended due to the woody vegetation already installed in this area. Areas where aggressive reed canarygrass is encroaching on planted woody species could be mechanically controlled to limit disturbance to plantings. Heavy browse from local wildlife has been observed across the entire site. Control measures such as chemical browse repellants should be considered to avoid further browse damage or eventual mortality to shrub and tree species.

A new jackleg fence was installed at the site in 2004. Bird boxes installed by MDT at the site were in good condition.

### 3.12 Current Credit Summary

As of 2006, approximately 23 acres of wetland and 2.41 acres of open water (restored stream channel/portions of excavated wetlands) occur at the Kleinschmidt Creek mitigation site. This represents an approximate increase of 9.22 wetland acres and a 5.18-acre decrease of over-excavated, straightened open water channel as compared to baseline conditions. Open water on the site is currently comprised of 1.75 acres of restored sinuous channel and 0.66 acre of excavated shallow water as a component of wetland creation. Functional units at the site have essentially doubled to over 212 since project construction.

**Table 11** summarizes the maximum credit that could be assigned to the site as of 2006. Target mitigation credit ratios and acres were agreed upon prior to site construction, with the exception of incidental wetland restoration within proposed upland buffer areas, for which no performance standards or ratios were discussed. As these areas are restoring naturally within the easement, a 1:1 credit ratio was assumed.

**Table 11: Maximum 2006 credit for the Kleinschmidt Creek Wetland Mitigation Site.**

Mitigation Type	Current Acres	Ratio	Current Maximum Credit Acres	Target Credit Acres	Comments
Designed Restoration	6.0	1:1	6.0	6.0	Does not include 1.75 acres of open water stream channel. Extrapolated stem density (1,413) is exceeding performance standard (500).
Designed Creation	1.19	1:1	1.19	1.19	Includes 0.66 acre of designed shallow open water. Extrapolated stem density along upland / wetland border (1,363) is exceeding assumed performance standard (500).
Designed High-Intensity Enhancement	8.05	1:2	4.02	4.02	Extrapolated stem density (2,185) is exceeding performance standard (1,000)
Designed Low-Intensity Enhancement	3.43	1:3	0.0	1.14	Plantings were destroyed by grazing. Actual stem density (46) is not meeting performance standard (500). No credit likely at this time. Recommend re-planting this area if credit is desired.
Incidental Restoration	4.99	1:1	4.99	0.0	4.99 acres of intended 12.69-acre upland buffer within easement reverted to emergent wetland. 1:1 ratio is assumed and has not been verified with the Corps of Engineers.
Designed Upland Buffer	7.7	4:1	1.93	3.17	4.99 acres of intended 12.69-acre upland buffer reverted to wetland.
<b>Grand Total</b>	<b>31.36</b>	<b>--</b>	<b>18.13</b>	<b>15.52</b>	<b>117% of goal</b>

## LWC / MDT WETLAND MITIGATION SITE MONITORING FORM

Project Name: Kleinschmidt Creek Project Number: 33054.00 0112 Assessment Date: 8/16/06  
Location: SE. of Ovando MDT District: Upper Clark Fork Milepost:       
Legal description: T 14 N R 11 W Section 5 & 8 Time of Day: Morning to Afternoon  
Weather Conditions: overcast Person(s) conducting the assessment: G. Howard  
Initial Evaluation Date: 9/03/02 Visit #: 5 Monitoring Year: 5  
Size of evaluation area: 36 acres Land use surrounding wetland: Agriculture

### HYDROLOGY

**Surface Water** Source: Hydrology source is spring feed, perennial Kleinschmidt Creek.  
Inundation: Present x Absent      Average depths: 2.5 ft Range of depths: 0-5 ft  
Assessment area under inundation: 30 %  
Depth at emergent vegetation-open water boundary: 0.6 ft (excavated wetlands)  
If assessment area is not inundated are the soils saturated w/in 12" of surface: Yes x No       
Other evidence of hydrology on site (drift lines, erosion, stained vegetation etc.): Large area of saturated wet-meadow for later part of summer months. Hydrology influenced by groundwater.

### Groundwater

Monitoring wells: Present      Absent x  
Record depth of water below ground surface

Well #	Depth	Well #	Depth	Well #	Depth

### Additional Activities Checklist:

x Map emergent vegetation-open water boundary on air photo  
x Observe extent of surface water during each site visit and look for evidence of past surface water elevations (drift lines, erosion, vegetation staining etc.)  
     GPS survey groundwater monitoring wells locations if present

**COMMENTS/PROBLEMS:** Similar site conditions observed during 2005 mid-summer visit. Inundation presents at both the created pads and excavated wetlands. The lower sections of the project have several large populations of noxious weeds including spotted knapweed, Canada thistle, musk thistle and oxeye daisy. The upper section has an increase in Canada thistle. One new species identified during 2006 monitoring, refer to vegetation list.

## VEGETATION COMMUNITIES

Community No.: 1 Community Title (main species): Medicago/Centaurea

Dominant Species	% Cover	Dominant Species	% Cover
<i>Medicago sativa</i>	60		
<i>Centaurea maculosa</i>	10		
<i>Phleum pratense</i>	10		

**COMMENTS/PROBLEMS:** Upland area adjacent to created pond # 2, vegetation dominated by mainly alfalfa, timothy and spotted knapweed. Transect # 1 begins at the boundary between the upland field and created wetland slopes.

Community No.: 2 Community Title (main species): Phleum/Melilotus

Dominant Species	% Cover	Dominant Species	% Cover
<i>Phleum pratense</i>	30	Plantings	P
<i>Centaurea maculosa</i>	P	<i>Poa pratensis</i>	T
<i>Carduus nutans</i>	T	<i>Trifolium spp.</i>	P
<i>Melilotus officinalis</i>	30	<i>Phalaris arundinacea</i>	T
<i>Chrysanthemum leucanthemum</i>	10	<i>Cirsium arvense</i>	P
<i>Linaria vulgare</i>	T	<i>Agropyron smithii</i>	P

**COMMENTS/PROBLEMS:** Slopes adjacent to pond # 2. Area mostly dominated by *Phleum pratense* and *Melilotus officinalis*. The remaining species are mostly invasive and include several state listed noxious weeds such as *Centaurea maculosa*, *Cirsium arvense* and *Chrysanthemum leucanthemum*. Native grasses seeded during construction have established a minor presence.

Community No.: 3 Community Title (main species): Phleum/Agrostis

Dominant Species	% Cover	Dominant Species	% Cover
<i>Phalaris arundinacea</i>	10		
<i>Phleum pratense</i>	10		
<i>Agrostis alba</i>	10		

**COMMENTS/PROBLEMS:** Emergent vegetation growing along the west side of excavated wetland. Transect # 1 bisects the west side of excavated wetland. During the 2005 mapping CT# 3 was changed to CT # 12 and removed from the Figure 3.

## VEGETATION COMMUNITIES (continued)

Community No.: 4 Community Title (main species): Juncus/Carex

Dominant Species	% Cover	Dominant Species	% Cover
<i>Juncus balticus</i>	30	<i>Solidago missouriensis</i>	T
<i>Carex nebrascensis</i>	20	<i>Trifolium spp.</i>	P
<i>Agrostis alba</i>	10	<i>Phleum pratense</i>	10
<i>Phalaris arundinacea</i>	10	<i>Epilobium ciliatum</i>	P
<i>Glyceria elata</i>	P	<i>Carex utriculata</i>	P

**COMMENTS/PROBLEMS:** Wet meadow dominated by wetland grass species. Areas located along outer edges of constructed wetland pads along creek.

Community No.: 5 Community Title (main species): Phalaris/Agrostis

Dominant Species	% Cover	Dominant Species	% Cover
<i>Phalaris arundinacea</i>	50	<i>Carex nebrascensis</i>	10
<i>Juncus ensifolius</i>	10	<i>Epilobium ciliatum</i>	P
<i>Agrostis alba</i>	30	<i>Typha latifolia</i>	T
<i>Deschampsia cespitosa</i>	P	<i>Carex utriculata</i>	P
<i>Mimulus guttatus</i>	P	<i>Plantings</i>	T
<i>Carex lanuginosa</i>	P		

**COMMENTS/PROBLEMS:** Wetlands adjacent to creek. Areas inundated during monitoring visit.

Community No.: 6 Community Title (main species): Juncus/Agrostis

Dominant Species	% Cover	Dominant Species	% Cover
<i>Phalaris arundinacea</i>	20	<i>Agropyron repens</i>	P
<i>Trifolium pratense</i>	10	<i>Bidens cernua</i>	20
<i>Agrostis alba</i>	20	<i>Juncus ensifolius</i>	30
<i>Typha latifolia</i>	P		
<i>Melilotus officinalis</i>	P		

**COMMENTS/PROBLEMS:** Excavated wetland located on the lower section of Kleinschmidt Creek project area. Emergent type vegetation dominates excavated wetland and fringes. During the 2005 mapping CT # 13 was added in place of the shallow open water category.

## VEGETATION COMMUNITIES (continued)

Community No.: 7 Community Title (main species): Carex/Juncus

Dominant Species	% Cover	Dominant Species	% Cover
<i>Juncus ensifolius</i>	20	<i>Potentilla anserina</i>	T
<i>Agrostis alba</i>	10		
<i>Carex nebrascensis</i>	40		
<i>Cirsium arvense</i>	T		
<i>Poa pratensis</i>	10		

**COMMENTS/PROBLEMS:** Area of emergent vegetation located below house and barn on lower section.  
Area heavily grazed in past.

Community No.: 8 Community Title (main species): Centaurea/Carduus

Dominant Species	% Cover	Dominant Species	% Cover
<i>Carduus nutans</i>	40	<i>Bromus inermis</i>	P
<i>Hyoscyamus niger</i>	P	<i>Cirsium arvense</i>	10
<i>Centaurea maculosa</i>	20	<i>Cynoglossum officinale</i>	P
<i>Agropyron repens</i>	P	<i>Linaria vulgare</i>	P
<i>Medicago sativa</i>	T	<i>Agropyron cristatum</i>	T

**COMMENTS/PROBLEMS:** Area near the bottom of the lowest section adjacent to old railroad grade.  
Upland area dominated by invasive species; *Carduus nutans*, *Centaurea maculosa* and *Cirsium arvense*.

Community No.: 9 Community Title (main species): Salix

Dominant Species	% Cover	Dominant Species	% Cover
<i>Salix lasiandra</i>	70		
<i>Phleum pratense</i>	10		
<i>Bromus inermis</i>	10		

**COMMENTS/PROBLEMS:** Small group of several mature pacific willows located near springs.

Community No.: 10 Community Title (main species): Salix/Alnus

Dominant Species	% Cover	Dominant Species	% Cover
<i>Salix bebbiana</i>	30		
<i>Alnus incana</i>	10		
<i>Phalaris arundinacea</i>	30		
<i>Agrostis alba</i>	20		

COMMENTS/PROBLEMS: Small group of several Bebb's willow and alder located near the beginning of the upstream section. Understory dominated by herbaceous species.

Community No.: 11 Community Title (main species): Bromus/Phleum

Dominant Species	% Cover	Dominant Species	% Cover
<i>Agropyron repens</i>	20	<i>Centaurea maculosa</i>	30
<i>Phleum pratense</i>	10		
<i>Bromus inermis</i>	20		
<i>Sisymbrium altissimum</i>	P		
<i>Potentilla fruticosa</i>	10		

COMMENTS/PROBLEMS: Upland areas dominated by grass species. Increase in noxious weed cover values recorded during 2006 monitoring.

Community No.: 12 Community Title (main species): Phalaris/Typha

Dominant Species	% Cover	Dominant Species	% Cover
<i>Phalaris arundinacea</i>	30	Aquatic vegetation	20
<i>Phleum pratense</i>	P	<i>Juncus ensifolius</i>	P
<i>Agrostis alba</i>	20	<i>Carex lanuginosa</i>	T
<i>Typha latifolia</i>	20		
<i>Eleocharis palustris</i>	P		

COMMENTS/PROBLEMS: Emergent vegetation growing along the west side of excavated wetland. Transect # 1 bisects the west side of excavated wetland. Some areas mapped as OW in 2004 are now considered as emergent and aquatic bed vegetation types.

Community No.: 13 Community Title (main species): Ranunculus/Juncus

Dominant Species	% Cover	Dominant Species	% Cover
<i>Phalaris arundinacea</i>	20	<i>Carex lanuginosa</i>	P
<i>Trifolium pratense</i>	P	<i>Bidens cernua</i>	10
<i>Agrostis alba</i>	30	<i>Juncus ensifolius</i>	30
<i>Typha latifolia</i>	P	<i>Ranunculus aquatilis</i> var. <i>hispidulus</i>	70
<i>Melilotus officinalis</i>	T	<i>Carex nebrascensis</i>	P
<i>Sagittaria latifolia</i>	P		

COMMENTS/PROBLEMS: Excavated wetland located on the lower section of Kleinschmidt Creek project area. Emergent and aquatic type vegetation dominates wetland and fringes. Increase in aquatic vegetation cover value. New species identified within this area including broadleaf arrowhead (*Sagittaria latifolia*).

Community No.: Community Title (main species):

Dominant Species	% Cover	Dominant Species	% Cover

COMMENTS/PROBLEMS:

## COMPREHENSIVE VEGETATION LIST

Species	Vegetation Community Number(s)	Species	Vegetation Community Number(s)
<i>Achillea millefolium</i>	2,11	<i>Juncus balticus</i>	4
<i>Agrostis alba</i>	3,4,5,6,7,10,11	<i>Juncus ensifolius</i>	5,6,7
<i>Agrostis exarata</i>	5	<i>Juncus mertensianus</i>	4,5,6,7
<i>Agropyron cristatum</i>	8	<i>Juncus nodosus</i>	4,5,7
<i>Agropyron repens</i>	6,8	<i>Linaria vulgaris</i>	4
<i>Agropyron smithii</i>	5	<i>Lychnis alba</i>	5
<i>Allium brevistylum</i>	4,5,7	<i>Medicago sativa</i>	1
<i>Alnus incana</i>	10	<i>Melilotus officinalis</i>	2,6,8
<i>Beckmannia syzigachne</i>	5	<i>Mentha arvensis</i>	4,5
<i>Betula glandulosa</i>	5,7	<i>Mimulus guttatus</i>	5
<i>Bidens cernua</i>	5	<i>Najas flexilis</i>	12, 13
<i>Bromus inermis</i>	8,9,11	<i>Pedicularis groenlandica</i>	4,5,7
<i>Bromus tectorum</i>	1	<i>Phalaris arundinacea</i>	2,3,4,5,6,10
<i>Calamagrostis canadensis</i>	4,5	<i>Phleum pratense</i>	1,2,3,4,9,11
<i>Carduus nutans</i>	2,8	<i>Plantago spp.</i>	5
<i>Carex aquatilis</i>	4,7	<i>Poa pratensis</i>	2,7
<i>Carex crawei</i>	4,7	<i>Polygonum amphibium</i>	5,6
<i>Carex flava</i>	4,5,7	<i>Potentilla anserina</i>	7
<i>Carex lanuginosa</i>	4,5,7	<i>Potentilla fruticosa</i>	4
<i>Carex nebrascensis</i>	4,5,7	<i>Ranunculus spp.</i>	5
<i>Carex utriculata</i>	4,5	<i>Ranunculus aquatilis</i> var. <i>hispidulus</i>	6
<i>Carex simulata</i>	4,5,7	<i>Rumex crispus</i>	2,5,7
<i>Centaurea maculosa</i>	1,2,8	<i>Sagittaria latifolia</i>	13
<i>Chenopodium album</i>	5	<i>Salix bebbiana</i>	4,5,7,10
<i>Chrysanthemum leucanthemum</i>	2	<i>Salix boothii</i>	2,3,4,5,6,7
<i>Cirsium arvense</i>	7	<i>Salix drummondiana</i>	2,3,4,5,6,7
<i>Cynoglossum officinale</i>	8	<i>Salix geyeriana</i>	2,3,4,5,6,7
<i>Deschampsia cespitosa</i>	5	<i>Salix lasiandra</i>	9
<i>Eleocharis palustris</i>	4,5,6,7	<i>Scirpus acutus</i>	12,13
<i>Epilobium ciliatum</i>	4,5	<i>Sisymbrium altissimum</i>	11
<i>Equisetum arvense</i>	3,4,5,6,7	<i>Sisyrinchium angustifolium</i>	4,5,7
<i>Equisetum hyemale</i>	5	<i>Solidago missouriensis</i>	4
<i>Eriophorum viridicarinaratum</i>	4,7	<i>Taraxacum officinale</i>	1,2,4,5,7,11
<i>Geum macrophyllum</i>	4,5,7	<i>Thlaspi arvense</i>	1,2,4,5,7,11
<i>Glyceria elata</i>	4	<i>Triglochin maritimum</i>	4,5
<i>Glyceria striata</i>	4,5,7	<i>Trifolium pratense</i>	2,4,6
<i>Habenaria dilatata</i>	4,5	<i>Typha latifolia</i>	5,6
<i>Hyoscyamus niger</i>	8	<i>Veronica americana</i>	5,6,7

**COMMENTS/PROBLEMS:** One new plant was identified in 2006: broadleaf arrowhead (*Sagittaria latifolia*).

## PLANTED WOODY VEGETATION SURVIVAL

[illegible]

**COMMENTS/PROBLEMS:** Due to the large number of woody plants installed at this mitigation site only stem density was counted. Survival for each species was not calculated. Refer to the revegetation section of report (Section 3.9) for survival data and summaries.

## WILDLIFE

### BIRDS

(Attach Bird Survey Field Forms)

Were man made nesting structures installed? Yes x No      Type: Boxes How many? 12 Are the nesting structures being utilized? Yes x No      Do the nesting structures need repairs? Yes      No x

### MAMMALS AND HERPTILES

Species	Number Observed	Indirect indication of use			
		Tracks	Scat	Burrows	Other
Deer		X	X		
Coyote			X		
Elk					X
Spotted Frog	1				
Striped Skunk	1				

#### Additional Activities Checklist:

  X   Macroinvertebrate sampling (if required)

**COMMENTS/PROBLEMS:** Macroinvertebrates sample were collected at two locations. These include the creek and pond along upper section during 2006.

## PHOTOGRAPHS

Using a camera with a 50 mm lenses and color film take photographs of the following permanent reference points listed in the checklist below. Record the direction of the photograph using a compass. (The first time at each site establish a permanent reference point by setting a ½ inch rebar or fencepost extending 2-3' above ground, survey the location with a resource grade GPS and mark the location on the air photo.)

Checklist:

- ☒ One photo for each of the 4 cardinal directions surrounding wetland
- ☒ At least one photo showing upland use surrounding wetland – if more than one upland use exists, take additional photos
- ☒ At least one photo showing buffer surrounding wetland
- ☒ One photo from each end of vegetation transect showing transect

Location	Photo Frame #	Photograph Description	Compass Reading
1	1	Looking north along transect.	0°
1	2	Looking west across upland pasture.	270°
2	3	Looking east across pond.	90°
2	4	Looking south at transect	180°
3	5-9	Panoramic looking west to east, upper section of site.	270° - 90°
4	10	Looking north along end of transect.	0°
5	11	Panoramic looking south at transect end.	180°
6	12-13	Looking west across upper end of site	270°
7	14	Looking northwest across created wetland pond on lower section.	270°
8	15	Looking northwest along channel.	270°
9	16	Looking southeast along channel.	135°
9	17	Looking northwest along channel.	315°
10	18-19	Looking northwest upland areas.	315°
11	20-21	Looking northwest at emergent wetlands and channel.	315°
11	22-23	Looking southeast along channel.	135°

### COMMENTS/PROBLEMS:

---

---

---

---

## GPS SURVEYING

Using a resource grade GPS survey the items on the checklist below. Collect at least 3 location points with the GPS unit set at 5 second recording rate. Record file numbers for site in designated GPS field notebook

Checklist:

- ☒ Jurisdictional wetland boundary
- ☒ 4-6 landmarks recognizable on the air photo
- ☒ Start and end points of vegetation transect(s)
- ☒ Photo reference points
- ☐ Groundwater monitoring well locations

### COMMENTS/PROBLEMS:

---

---

## WETLAND DELINEATION

(Attach Corps of Engineers delineation forms)

At each site conduct the items on the checklist below:

☒ Delineate wetlands according to the 1987 Army Corps manual.

☒ Delineate wetland-upland boundary on the air photo

☐ Survey wetland-upland boundary with a resource grade GPS survey

**COMMENTS/PROBLEMS:** \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

## FUNCTIONAL ASSESSMENT

(Complete and attach full MDT Montana Wetland Assessment Method field forms; also attach abbreviated field forms, if used)

**COMMENTS/PROBLEMS:**

## MAINTENANCE

Were man-made nesting structures installed at this site? YES ☒ NO ☐

If yes, do they need to be repaired? YES ☐ NO ☒

If yes, describe problems below and indicate if any actions were taken to remedy the problems.

Were man-made structures build or installed to impound water or control water flow into or out of the wetland? YES ☐ NO ☒

If yes, are the structures working properly and in good working order? YES ☐ NO ☐

If no, describe the problems below.

# MDT WETLAND MONITORING – VEGETATION TRANSECT

Site: Kleinschmidt Creek Date: 8/16/06 Examiner: G. Howard Transect # 1

Approx. transect length: 222ft. Compass Direction from Start (Upland): 0°

Vegetation type 1:		Medicago/Centaurea
Length of transect in this type:	15	feet
Species:	Cover:	
Phleum pratense	40	
Poa pratensis	20	
Agropyron repens	P	
Agrostis alba	P	
Phalaris arundinacea	P	
Medicago sativa	P	
Alnus incana (Planted)	T	
Centaurea maculosa	T	
Total Vegetative Cover:		80%

Vegetation type 2:		Phalaris/Typha
Length of transect in this type:	57	feet
Species:	Cover:	
Phleum pratense	P	
Agrostis alba	10	
Typha latifolia	20	
Epilobium ciliatum	T	
Juncus ensifolius	P	
Salix boothii (Planted)	P	
Phalaris arundinacea	30	
Eleocharis palustris	P	
Alnus incana (Planted)	T	
Salix geyeriana (Sprigged)	T	
Total Vegetative Cover:		70%

Vegetation type 3:		Juncus/Carex
Length of transect in this type:	60	feet
Species:	Cover:	
Phalaris arundinacea	30	
Juncus balticus	30	
Poa pratensis	P	
Carex nebrascensis	20	
Triglochin maritimum	T	
Juncus ensifolius	P	
Equisetum hyemale	T	
Phleum pratense	P	
Agrostis alba	10	
Carex utriculata	P	
Total Vegetative Cover:		95%

Vegetation type 4:		Phalaris/Agrostis
Length of transect in this type:	90	feet
Species:	Cover:	
Phalaris arundinacea	30	
Agrostis alba	40	
Phleum pratense	P	
Beckmannia syzigachne	T	
Plantings	P	
Carex nebrascensis	P	
Deschampsia cespitosa	T	
Juncus ensifolius	20	
Carex lanuginosa	P	
Carex utriculata	10	
Total Vegetative Cover:		100%

MDT WETLAND MONITORING – VEGETATION TRANSECT (back of form)

**Cover Estimate**

+ = <1%      3 = 11-20%  
1 = 1-5%      4 = 21-50%  
2 = 6-10%    5 = >50%

**Indicator Class:**

+ = Obligate  
- = Facultative/Wet  
0 = Facultative

**Source:**

P = Planted  
V = Volunteer

Percent of perimeter \_\_\_\_\_ % developing wetland vegetation – excluding dam/berm structures.

Establish transects perpendicular to the shoreline (or saturated perimeter). The transect should begin in the upland area. Permanently mark this location with a standard metal fencepost. Extend the imaginary transect line towards the center of the wetland, ending at the 3 foot depth (in open water), or at a point where water depths or saturation are maximized. Mark this location with another metal fencepost.

Estimate cover within a 10 ft wide “belt” along the transect length. At a minimum, establish a transect at the windward and leeward sides of the wetland. Remember that the purpose of this sampling is to monitor, not inventory, representative portions of the wetland site.

Notes:

## BIRD SURVEY – FIELD DATA SHEET

Page\_\_1\_of\_1\_\_

Date: 8/16/06

**SITE:** Kleinschmidt Creek

Survey Time: 9:00-4:00

[illegible]

**Notes:**

**Behavior:** BP – one of a breeding pair; BD – breeding display; F – foraging; FO – flyover; L – loafing; N – nesting

**Habitat:** AB – aquatic bed; FO – forested; I – island; MA – marsh; MF – mud flat; OW – open water; SS – scrub/shrub; UP – upland buffer; WM – wet meadow, US – unconsolidated shoreline

**Common Comments:**

## 12. GENERAL CONDITION OF AA

**i. Regarding Disturbance:** (Use matrix below to select appropriate response.)

Conditions Within AA	Predominant Conditions Adjacent (within 500 Feet) To AA		
	Land managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings.	Land not cultivated, but moderately grazed or hayed or selectively logged or has been subject to minor clearing; contains few roads or buildings.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density.
AA occurs and is managed in predominantly a natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings.	---	---	---
AA not cultivated, but moderately grazed or hayed or selectively logged or has been subject to relatively minor clearing, or fill placement, or hydrological alteration; contains few roads or buildings.	---	moderate disturbance	---
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density.	---	---	---

**Comments:** (types of disturbance, intensity, season, etc.) Livestock grazing and hay production.

ii. **Prominent weedy, alien, & introduced species:** Spotted knapweed, Canada thistle, oxeye daisy, black henbane, pennycress, musk thistle, and butter & eggs.

iii. Briefly describe AA and surrounding land use / habitat: AA is a riparian corridor with spring fed Kleinschmidt creek and adjacent wetlands. Surrounding land use includes livestock grazing and hay fields. AA located along HWY 200, 5 miles E. of Ovando.

**13. STRUCTURAL DIVERSITY** (Based on 'Class' column of #10 above.)

Number of 'Cowardin' Vegetated Classes Present in AA	≥3 Vegetated Classes or ≥ 2 if one class is forested	2 Vegetated Classes or 1 if forested	≤ 1 Vegetated Class
Select Rating	---	---	Low

**Comments:**

#### 14A. HABITAT FOR FEDERALLY LISTED OR PROPOSED THREATENED OR ENDANGERED PLANTS AND ANIMALS

i. AA is Documented (D) or Suspected (S) to contain (check box):

Primary or Critical habitat (list species) ☐ D ☐ S \_\_\_\_\_  
 Secondary habitat (list species) ☒ D ☐ S Bull trout  
 Incidental habitat (list species) ☒ D ☐ S Bald eagle  
 No usable habitat ☐ D ☒ S Grizzly bear, Lynx

ii. Rating (Based on the strongest habitat chosen in 14A(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point & Rating	---	---	.8 (M)	---	---	---	---

If documented, list the source (e.g., observations, records, etc.): FWP

#### 14B. HABITAT FOR PLANTS AND ANIMALS RATED AS S1, S2, OR S3 BY THE MONTANA NATURAL HERITAGE PROGRAM.

Do not include species listed in 14A(i).

i. AA is Documented (D) or Suspected (S) to contain (check box):

Primary or Critical habitat (list species) ☒ D ☐ S Crowsedge (S2) & green-keeled cottongrass (S3)  
 Secondary habitat (list species) ☒ D ☐ S Westslope cutthroat trout  
 Incidental habitat (list species) ☐ D ☒ S Common loon  
 No usable habitat ☐ D ☒ S Missoual phlox

ii. Rating: Based on the strongest habitat chosen in 14B(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point & Rating	1(H)	---	---	---	---	---	---

If documented, list the source (e.g., observations, records, etc.): FWP & plants identified at the site during 2005

#### 14C. GENERAL WILDLIFE HABITAT RATING

i. Evidence of overall wildlife use in the AA: Check either substantial, moderate, or low.

☐ Substantial (based on any of the following)

- ☐ observations of abundant wildlife #s or high species diversity (during any period)
- ☐ abundant wildlife sign such as scat, tracks, nest structures, game trails, etc.
- ☐ presence of extremely limiting habitat features not available in the surrounding area
- ☐ interviews with local biologists with knowledge of the AA

☐ Low (based on any of the following)

- ☐ few or no wildlife observations during peak use periods
- ☐ little to no wildlife sign
- ☐ sparse adjacent upland food sources
- ☐ interviews with local biologists with knowledge of AA

☒ Moderate (based on any of the following)

- ☒ observations of scattered wildlife groups or individuals or relatively few species during peak periods
- ☒ common occurrence of wildlife sign such as scat, tracks, nest structures, game trails, etc.
- ☒ adequate adjacent upland food sources
- ☐ interviews with local biologists with knowledge of the AA

ii. Wildlife Habitat Features: Working from top to bottom, select the AA attribute to determine the exceptional (E), high (H), moderate (M), or low (L) rating. Structural diversity is from 13. For class cover to be considered evenly distributed, vegetated classes must be within 20% of each other in terms of their percent composition in the AA (see 10). Duration of Surface Water: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral; A = absent.

Structural Diversity (from 13)	<input type="checkbox"/> High								<input type="checkbox"/> Moderate								<input checked="" type="checkbox"/> Low			
	<input type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input checked="" type="checkbox"/> Even			
Class Cover Distribution (all vegetated classes)	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A
Duration of Surface Water in ≥ 10% of AA																				
Low disturbance at AA (see 12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (see 12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	H	--	--	--
High disturbance at AA (see 12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

iii. Rating: Use 14C(i) and 14C(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L) for this function.

Evidence of Wildlife Use from 14C(i)	Wildlife Habitat Features Rating from 14C(ii)			
	<input type="checkbox"/> Exceptional	<input checked="" type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Substantial	--	--	--	--
Moderate	--	.7 (M)	--	--
Low	--	--	--	--

Comments: \_\_\_\_\_

**14D. GENERAL FISH / AQUATIC HABITAT RATING** ☐ NA (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat or excessive gradient, then check the NA box above.

Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [e.g. fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (e.g. fish use within an irrigation canal), then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

**i. Habitat Quality:** Pick the appropriate AA attributes in matrix to determine the quality rating of exceptional (E), high (H), moderate (M), or low (L).

Duration of Surface Water in AA	<input checked="" type="checkbox"/> Permanent/Perennial			<input type="checkbox"/> Seasonal / Intermittent			<input type="checkbox"/> Temporary / Ephemeral		
	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
Cover - % of waterbody in AA containing cover objects (e.g. submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)									
Shading - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
Shading - 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--
Shading - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	M	--	--	--	--	--	--	--

**ii. Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity or is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support?

☐ Y ☐ N If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: ☐ E ☐ H ☐ M ☐ L

**iii. Rating:** Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).

Types of Fish Known or Suspected within AA	Modified Habitat Quality from 14D(ii)			
	<input type="checkbox"/> Exceptional	<input type="checkbox"/> High	<input checked="" type="checkbox"/> Moderate	<input type="checkbox"/> Low
Native game fish	--	--	.7 (M)	--
Introduced game fish	--	--	--	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: \_\_\_\_\_

**14E. FLOOD ATTENUATION** ☒ NA (proceed to 14G)

Applies only to wetlands subject to flooding via in-channel or overbank flow. If wetlands in AA do not flood from in-channel or overbank flow, then check NA.

**i. Rating:** Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Estimated wetland area in AA subject to periodic flooding	<input type="checkbox"/> ≥ 10 acres			<input type="checkbox"/> <10, >2 acres			<input type="checkbox"/> ≤2 acres		
	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
% of flooded wetland classified as forested, scrub/shrub, or both									
AA contains no outlet or restricted outlet	--	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	--	--	--	--	--	--	--	--	--

**ii. Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA? (check)**

☐ Y ☐ N Comments: \_\_\_\_\_

**14F. SHORT AND LONG TERM SURFACE WATER STORAGE** ☐ NA (proceed to 14G)

Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.

If no wetlands in the AA are subject to flooding or ponding, then check NA above.

**i. Rating:** Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	<input checked="" type="checkbox"/> >5 acre feet			<input type="checkbox"/> <5, >1 acre feet			<input type="checkbox"/> ≤1 acre foot		
	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
Duration of surface water at wetlands within the AA									
Wetlands in AA flood or pond ≥ 5 out of 10 years	1 (H)	--	--	--	--	--	--	--	--
Wetlands in AA flood or pond < 5 out of 10 years	--	--	--	--	--	--	--	--	--

Comments: \_\_\_\_\_

**14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL** ☐ NA (proceed to 14H)

Applies to wetlands with the potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.

If no wetlands in the AA are subject to such input, check NA above.

**i. Rating** Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants or AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
	<input checked="" type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%		<input type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%	
% cover of wetland vegetation in AA	<input checked="" type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No
Evidence of flooding or ponding in AA								
AA contains no or restricted outlet	--	--	--	--	--	--	--	--
AA contains unrestricted outlet	.9 (H)	--	--	--	--	--	--	--

Comments: \_\_\_\_\_

**14H. SEDIMENT/ShORELINE STABILIZATION**☐ NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, then check NA above.

i. **Rating:** Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding rootmasses.	Duration of Surface Water Adjacent to Rooted Vegetation		
	<input type="checkbox"/> Permanent / Perennial	<input type="checkbox"/> Seasonal / Intermittent	<input type="checkbox"/> Temporary / Ephemeral
≥ 65 %	1 (H)	--	--
35-64 %	--	--	--
< 35 %	--	--	--

Comments: Sedges, rushes and willows along shoreline.

**14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT**

i. **Rating:** Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

A = acreage of vegetated component in the AA. B = structural diversity rating from #13. C = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet. P/P = permanent/perennial; S/I = seasonal/intermittent; T/E/A = temporary/ephemeral/absent.

A	<input checked="" type="checkbox"/> Vegetated component >5 acres						<input type="checkbox"/> Vegetated component 1-5 acres						<input type="checkbox"/> Vegetated component <1 acre

**Common**                      **Comments:**

## 12. GENERAL CONDITION OF AA

**i. Regarding Disturbance:** (Use matrix below to select appropriate response.)

Conditions Within AA	Predominant Conditions Adjacent (within 500 Feet) To AA		
	Land managed in predominantly natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or buildings.	Land not cultivated, but moderately grazed or hayed or selectively logged or has been subject to minor clearing; contains few roads or buildings.	Land cultivated or heavily grazed or logged; subject to substantial fill placement, grading, clearing, or hydrological alteration; high road or building density.
AA occurs and is managed in predominantly a natural state; is not grazed, hayed, logged, or otherwise converted; does not contain roads or occupied buildings.	---	---	---
AA not cultivated, but moderately grazed or hayed or selectively logged or has been subject to relatively minor clearing, or fill placement, or hydrological alteration; contains few roads or buildings.	---	moderate disturbance	---
AA cultivated or heavily grazed or logged; subject to relatively substantial fill placement, grading, clearing, or hydrological alteration; high road or building density.	---	---	---

**Comments:** (types of disturbance, intensity, season, etc.) Livestock grazing and hay production.

ii. **Prominent weedy, alien, & introduced species:** Spotted knapweed, Canada thistle, oxeye daisy, black henbane, pennycress, musk thistle, and butter & eggs.

iii. **Briefly describe AA and surrounding land use / habitat:** AA is a riparian corridor with spring fed Kleinschmidt creek and adjacent wetlands. Surrounding land use includes livestock grazing and hay fields. AA located along HWY 200, 5 miles E. of Ovando.

### 13. STRUCTURAL DIVERSITY (Based on 'Class' column of #10 above.)

Number of 'Cowardin' Vegetated Classes Present in AA	≥3 Vegetated Classes or ≥ 2 if one class is forested	2 Vegetated Classes or 1 if forested	≤ 1 Vegetated Class
Select Rating	---	Moderate	---

**Comments:**

#### 14A. HABITAT FOR FEDERALLY LISTED OR PROPOSED THREATENED OR ENDANGERED PLANTS AND ANIMALS

i. AA is Documented (D) or Suspected (S) to contain (check box):

Primary or Critical habitat (list species) ☐ D ☐ S \_\_\_\_\_  
 Secondary habitat (list species) ☐ D ☐ S \_\_\_\_\_  
 Incidental habitat (list species) ☒ D ☐ S Bald eagle  
 No usable habitat ☐ D ☐ S \_\_\_\_\_

ii. Rating (Based on the strongest habitat chosen in 14A(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point & Rating	---	---	---	---	.5 (L)	---	---

If documented, list the source (e.g., observations, records, etc.): FWP

#### 14B. HABITAT FOR PLANTS AND ANIMALS RATED AS S1, S2, OR S3 BY THE MONTANA NATURAL HERITAGE PROGRAM.

Do not include species listed in 14A(i).

i. AA is Documented (D) or Suspected (S) to contain (check box):

Primary or Critical habitat (list species) ☐ D ☐ S \_\_\_\_\_  
 Secondary habitat (list species) ☐ D ☐ S \_\_\_\_\_  
 Incidental habitat (list species) ☐ D ☒ S Common loon  
 No usable habitat ☐ D ☐ S \_\_\_\_\_

ii. Rating: Based on the strongest habitat chosen in 14B(i) above, find the corresponding rating of High (H), Moderate (M), or Low (L) for this function.

Highest Habitat Level	doc/primary	sus/primary	doc/secondary	sus/secondary	doc/incidental	sus/incidental	none
Functional Point & Rating	---	---	---	---	---	.1 (L)	---

If documented, list the source (e.g., observations, records, etc.): FWP

#### 14C. GENERAL WILDLIFE HABITAT RATING

i. Evidence of overall wildlife use in the AA: Check either substantial, moderate, or low.

☐ Substantial (based on any of the following)

- ☐ observations of abundant wildlife #s or high species diversity (during any period)
- ☐ abundant wildlife sign such as scat, tracks, nest structures, game trails, etc.
- ☐ presence of extremely limiting habitat features not available in the surrounding area
- ☐ interviews with local biologists with knowledge of the AA

☐ Low (based on any of the following)

- ☐ few or no wildlife observations during peak use periods
- ☐ little to no wildlife sign
- ☐ sparse adjacent upland food sources
- ☐ interviews with local biologists with knowledge of AA

☒ Moderate (based on any of the following)

- ☒ observations of scattered wildlife groups or individuals or relatively few species during peak periods
- ☒ common occurrence of wildlife sign such as scat, tracks, nest structures, game trails, etc.
- ☒ adequate adjacent upland food sources
- ☒ interviews with local biologists with knowledge of the AA

ii. Wildlife Habitat Features: Working from top to bottom, select the AA attribute to determine the exceptional (E), high (H), moderate (M), or low (L) rating. Structural diversity is from 13. For class cover to be considered evenly distributed, vegetated classes must be within 20% of each other in terms of their percent composition in the AA (see 10). Duration of Surface Water: P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral; A = absent.

Structural Diversity (from 13)	<input type="checkbox"/> High								<input checked="" type="checkbox"/> Moderate								<input type="checkbox"/> Low			
	<input type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input checked="" type="checkbox"/> Even				<input type="checkbox"/> Uneven				<input type="checkbox"/> Even			
Class Cover Distribution (all vegetated classes)	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A	P/P	S/I	T/E	A
Duration of Surface Water in ≥ 10% of AA																				
Low disturbance at AA (see 12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Moderate disturbance at AA (see 12)	--	--	--	--	--	--	--	--	H	--	--	--	--	--	--	--	--	--	--	--
High disturbance at AA (see 12)	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

iii. Rating: Use 14C(i) and 14C(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L) for this function.

Evidence of Wildlife Use from 14C(i)	Wildlife Habitat Features Rating from 14C(ii)			
	<input type="checkbox"/> Exceptional	<input checked="" type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Substantial	--	--	--	--
Moderate	--	.7 (M)	--	--
Low	--	--	--	--

Comments: \_\_\_\_\_

**14D. GENERAL FISH / AQUATIC HABITAT RATING** ☒ **NA** (proceed to 14E)

If the AA is not or was not historically used by fish due to lack of habitat or excessive gradient, then check the NA box above.

Assess if the AA is used by fish or the existing situation is "correctable" such that the AA could be used by fish [e.g. fish use is precluded by perched culvert or other barrier, etc.]. If fish use occurs in the AA but is not desired from a resource management perspective (e.g. fish use within an irrigation canal), then Habitat Quality [14D(i)] below should be marked as "Low", applied accordingly in 14D(ii) below, and noted in the comments.

**i. Habitat Quality:** Pick the appropriate AA attributes in matrix to determine the quality rating of exceptional (E), high (H), moderate (M), or low (L).

Duration of Surface Water in AA	<input type="checkbox"/> Permanent/Perennial			<input type="checkbox"/> Seasonal / Intermittent			<input type="checkbox"/> Temporary / Ephemeral		
	>25%	10-25%	<10%	>25%	10-25%	<10%	>25%	10-25%	<10%
<b>Cover</b> - % of waterbody in AA containing cover objects (e.g. submerged logs, large rocks & boulders, overhanging banks, floating-leaved vegetation)									
<b>Shading</b> - >75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities	--	--	--	--	--	--	--	--	--
<b>Shading</b> - 50 to 75% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--
<b>Shading</b> - < 50% of streambank or shoreline of AA contains riparian or wetland scrub-shrub or forested communities.	--	--	--	--	--	--	--	--	--

**ii. Modified Habitat Quality:** Is fish use of the AA precluded or significantly reduced by a culvert, dike, other man-made structure or activity or is the waterbody included on the 'MDEQ list of waterbodies in need of TMDL development' with 'Probable Impaired Uses' listed as cold or warm water fishery or aquatic life support?

☐ Y ☐ N If yes, reduce the rating from 14D(i) by one level and check the modified habitat quality rating: ☐ E ☐ H ☐ M ☐ L

**iii. Rating:** Use the conclusions from 14D(i) and 14D(ii) above and the matrix below to arrive at the functional point and rating of exceptional (E), high (H), moderate (M), or low (L).

Types of Fish Known or Suspected within AA	Modified Habitat Quality from 14D(ii)			
	<input type="checkbox"/> Exceptional	<input type="checkbox"/> High	<input type="checkbox"/> Moderate	<input type="checkbox"/> Low
Native game fish	--	--	--	--
Introduced game fish	--	--	--	--
Non-game fish	--	--	--	--
No fish	--	--	--	--

Comments: \_\_\_\_\_

**14E. FLOOD ATTENUATION** ☒ **NA** (proceed to 14G)

Applies only to wetlands subject to flooding via in-channel or overbank flow. If wetlands in AA do not flood from in-channel or overbank flow, then check NA.

**i. Rating:** Working from top to bottom, mark the appropriate attributes to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Estimated wetland area in AA subject to periodic flooding	<input type="checkbox"/> ≥ 10 acres			<input type="checkbox"/> <10, >2 acres			<input type="checkbox"/> ≤2 acres		
	75%	25-75%	<25%	75%	25-75%	<25%	75%	25-75%	<25%
% of flooded wetland classified as forested, scrub/shrub, or both									
AA contains <b>no outlet or restricted outlet</b>	--	--	--	--	--	--	--	--	--
AA contains <b>unrestricted outlet</b>	--	--	--	--	--	--	--	--	--

**ii. Are residences, businesses, or other features which may be significantly damaged by floods located within 0.5 miles downstream of the AA? (check)**

☐ Y ☐ N Comments: \_\_\_\_\_

**14F. SHORT AND LONG TERM SURFACE WATER STORAGE** ☐ **NA** (proceed to 14G)

Applies to wetlands that flood or pond from overbank or in-channel flow, precipitation, upland surface flow, or groundwater flow.

If no wetlands in the AA are subject to flooding or ponding, then check NA above.

**i. Rating:** Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

P/P = permanent/perennial; S/I = seasonal/intermittent; T/E = temporary/ephemeral.

Estimated maximum acre feet of water contained in wetlands within the AA that are subject to periodic flooding or ponding.	<input checked="" type="checkbox"/> >5 acre feet			<input type="checkbox"/> <5, >1 acre feet			<input type="checkbox"/> ≤1 acre foot		
	P/P	S/I	T/E	P/P	S/I	T/E	P/P	S/I	T/E
<b>Duration of surface water at wetlands within the AA</b>									
Wetlands in AA flood or pond ≥ 5 out of 10 years	1 (H)	--	--	--	--	--	--	--	--
Wetlands in AA flood or pond < 5 out of 10 years	--	--	--	--	--	--	--	--	--

Comments: \_\_\_\_\_

**14G. SEDIMENT/NUTRIENT/TOXICANT RETENTION AND REMOVAL** ☐ **NA** (proceed to 14H)

Applies to wetlands with the potential to receive excess sediments, nutrients, or toxicants through influx of surface or ground water or direct input.

If no wetlands in the AA are subject to such input, check NA above.

**i. Rating** Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

Sediment, Nutrient, and Toxicant Input Levels Within AA	AA receives or surrounding land use has potential to deliver low to moderate levels of sediments, nutrients, or compounds such that other functions are not substantially impaired. Minor sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.				Waterbody on MDEQ list of waterbodies in need of TMDL development for "probable causes" related to sediment, nutrients, or toxicants or AA receives or surrounding land use has potential to deliver high levels of sediments, nutrients, or compounds such that other functions are substantially impaired. Major sedimentation, sources of nutrients or toxicants, or signs of eutrophication present.			
	<input type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%		<input type="checkbox"/> ≥ 70%		<input type="checkbox"/> < 70%	
% cover of wetland vegetation in AA	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input checked="" type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> Yes	<input type="checkbox"/> No
Evidence of flooding or ponding in AA								
AA contains <b>no or restricted outlet</b>	--	--	.7 (M)	--	--	--	--	--
AA contains <b>unrestricted outlet</b>	--	--	--	--	--	--	--	--

Comments: \_\_\_\_\_

**14H. SEDIMENT/ShORELINE STABILIZATION**☐ NA (proceed to 14I)

Applies only if AA occurs on or within the banks of a river, stream, or other natural or man-made drainage, or on the shoreline of a standing water body that is subject to wave action. If this does not apply, then check NA above.

i. **Rating:** Working from top to bottom, use the matrix below to arrive at the functional point and rating exceptional (E), high (H), moderate (M), or low (L) for this function.

% Cover of wetland streambank or shoreline by species with deep, binding rootmasses.	Duration of Surface Water Adjacent to Rooted Vegetation		
	<input type="checkbox"/> Permanent / Perennial	<input type="checkbox"/> Seasonal / Intermittent	<input type="checkbox"/> Temporary / Ephemeral
≥ 65 %	--	--	--
35-64 %	.7 (M)	--	--
< 35 %	--	--	--

Comments: \_\_\_\_\_

**14I. PRODUCTION EXPORT / FOOD CHAIN SUPPORT**

i. **Rating:** Working from top to bottom, use the matrix below to arrive at the functional point and rating of high (H), moderate (M), or low (L) for this function.

A = acreage of vegetated component in the AA. B = structural diversity rating from #13. C = Yes (Y) or No (N) as to whether or not the AA contains a surface or subsurface outlet. P/P = permanent/perennial; S/I = seasonal/intermittent; T/E/A = temporary/ephemeral/absent.

A	<input type="checkbox"/> Vegetated component >5 acres						<input checked="" type="checkbox"/> Vegetated component 1-5 acres						<input type="checkbox"/> Vegetated component <1 acre

### **GPS PROTOCOL**

---

*MDT Wetland Mitigation Monitoring  
Kleinschmidt Creek  
Montana*

## **GPS Mapping and Aerial Photo Referencing Procedure**

The wetland boundaries, photograph location points and sampling locations were field located with mapping grade Trimble Geo III GPS units. The data was collected with a minimum of three positions per feature using Course/Acquisition code. The collected data was then transferred to a PC and differentially corrected to the nearest operating Community Base Station. The corrected data was then exported to ACAD drawings in Montana State Plain Coordinates NAD 83 international feet.

The GPS positions collected and processed had a 68% accuracy of 7 feet except in isolated areas of Tasks .008 and .011, where it went to 12 feet. This is within the 1 to 5 meter range listed as the expected accuracy of the mapping grade Trimble GPS.

Aerial reference points were used to position the aerial photographs. This positioning did not remove the distortion inherent in all photos; this imagery is to be used as a visual aide only. The located wetland boundaries were given a final review by the wetland biologist and adjustments were made if necessary.

Any relationship of features located to easement or property lines are not to be construed from these figures. These relationships can only be determined with a survey by a licensed surveyor.

### **2006 MACROINVERTEBRATE SAMPLING PROTOCOL AND DATA**

---

*MDT Wetland Mitigation Monitoring  
Kleinschmidt Creek  
Montana*

# **AQUATIC INVERTEBRATE SAMPLING PROTOCOL**

## **Equipment List**

- D-frame sampling net with 1 mm mesh. Wildco is a good source of these.
- Spare net.
- 1-liter plastic sample jars, wide-mouth. VWR has these: catalog #36319-707.
- 95% ethanol: Northwest Scientific in Billings carries this.

All these other things are generally available at hardware or sporting goods stores. Make the labels on an ink jet printer preferably.

- hip waders.
- pre-printed sample labels (printed on Rite-in-the-Rain or other coated paper, two labels per sample).
- pencil.
- plastic pail (3 or 5 gallon).
- large tea strainer or framed screen.
- towel.
- tape for affixing label to jar.
- cooler with ice for sample storage.

## **Site Selection**

Select the sampling site with these considerations in mind:

- Select a site accessible with hip waders. If substrates are too soft, lay a wide board down to walk on.
- Determine a location that is representative of the overall condition of the wetland.

## **Sampling**

Wetland invertebrates inhabit the substrate, the water column, the stems and leaves of aquatic vegetation, and the water surface. Your goal is to sweep the collecting net through each of these habitat types, and then to combine the resulting samples into the 1-liter sample jar.

Dip out about a gallon of water into the pail. Pour about a cup of ethanol into the sample jar. Fill out the top half of the sample labels, using pencil, since ink will dissolve in the ethanol.

Ideally, you can sample a swath of water column from near-shore outward to a depth of approximately 3 feet with a long sweep of the net, keeping the net at about half the depth of the water throughout the sweep. Sweep the water surface as well. Pull the net through a vegetated area, beneath the water surface, for at least a meter of distance.

Sample the substrate by pulling the net along the bottom, bumping it against the substrate several times as you pull.

This step is optional, but it gives you a chance to see that you've collected some invertebrates. Rinse the net out into the bucket, and look for insects, crustaceans, etc. If necessary, repeat the sampling process in a nearby location, and add the net contents to the bucket. Remember to sample all four environments.

Sieve the contents of the bucket through the straining device and pour or carefully scrape the contents of the strainer into the sample jar.

If you skip the bucket-and-sieve steps, simply lift handfuls of material out of the sampling net into the jars. In either case, please include some muck or mud and some vegetation in the jar. Often, you will have collected a large amount of vegetable material. If this is the case, lift out handfuls of material from the sieve into the jar, until the jar is about half full. Please limit material you include in the sample, so that there is only a single jar for each sample.

Top off the sample jar with enough ethanol to cover all the material in the jar. Leave as little headroom as possible.

It is not necessary to sample habitats in any specified order. Keep in mind that disturbing the habitats prior to sampling will chase off the animals you are trying to capture.

Complete the sample labels. Place one label inside the sample jar and tape the other label securely to the outside of the jar. Dry the jar before attaching the outer label if necessary. In some situations, it may be necessary to collect more than one sample at a site. If you take multiple samples from the same site, clearly indicate this by using individual sample numbers, along with the total number of samples collected at the site (e.g. Sample #3 of 5 total samples).

Photograph the sampled site.

### **Sample Handling/Shipping**

- In the field, keep collected samples cool by storing them in a cooler. Only a small amount of ice is necessary.
- Inventory all samples, preparing a list of all sites and enumerating all samples, before shipping or delivering to the laboratory.
- Deliver samples to Rhithron.

# **MDT Mitigated Wetland Monitoring Project: Aquatic Invertebrate Monitoring Summary 2001 – 2006**

Prepared for PBS&J, Inc.

Prepared by W.Bollman, Rhithron Associates, Inc.

## **INTRODUCTION**

Among other monitoring activities, aquatic invertebrate assemblages were collected at a number of mitigated wetlands throughout Montana. This report summarizes data generated from six years of collection. Over all years of sampling, a total of 182 invertebrate samples were collected. Table 2 summarizes sites and sampling years.

## **METHODS**

### **Sample processing**

Aquatic invertebrate samples were collected at mitigated wetland sites in the summer months of 2001, 2002, 2003, 2004, 2005 and 2006 by personnel of PBS&J, Inc. Sampling procedures utilized were based on the protocols developed by the Montana Department of Environmental Quality (MT DEQ). Sampling consisted of D-frame net sweeps through emergent vegetation (when present), the water column, and over the water surface, and included disturbing and scraping substrates at each sampled site. These sample components were composited and preserved in ethanol at each wetland site. Samples were delivered to Rhithron Associates, Inc. for processing, taxonomic determinations, and data analysis.

At Rhithron's laboratory, Caton subsamplers and stereomicroscopes with 10X magnification were used to randomly select a minimum of 100 organisms from each sample. In some instances, the entire sample contained fewer than 100 organisms; in these cases, all organisms from the sample were taken. Animals were identified to lowest practical taxonomic levels using relevant published resources. Quality control (QC) procedures were applied to sample sorting, taxonomic determinations and enumeration, and data entry. QC statistics are presented in Table 3. The identified samples have been archived at Rhithron's laboratory.

### **Assessment**

The method employed to assess these wetlands is based on an index incorporating a battery of 12 bioassessment metrics or attributes (Table 1) tested and recommended by Stribling et al. (1995) in a report to the Montana Department of Health and Environmental Science. In that study, it was determined that some of the metrics were of limited use in some geographic regions, and for some wetland types. Despite that finding, all 12 metrics are used in this evaluation of mitigated wetlands, since detailed geographic information and wetland classifications were unavailable.

Scoring criteria for metrics were developed by generally following the tactic used by Stribling et al. Boxplots were generated using a statistical software package (Statistica™), and distributions, median values, ranges, and quartiles for each metric were examined. All sites in all years of sampling were used. Camp Creek, which was sampled in 2002, 2003, 2004, 2005 and 2006, and Kleinschmidt Creek, sampled in 2003, 2004, 2005 and 2006, were assessed using the tested metric battery developed for montane streams of Western Montana (Bollman 1998). Invertebrate assemblages at these sites differed from those of the other sites, and suggested montane or foothill stream conditions rather than wetland conditions. For the wetland sites, "optimal" scores were generally those that fell above the 75<sup>th</sup> percentile (for those metrics that decrease in value in response to stress) or below the 25<sup>th</sup> percentile (for metrics that respond to stress by an increase in value) of all scores. Additional scoring ranges were established by bisecting the range below the 75<sup>th</sup> percentile for decreasing scores (or above the 25<sup>th</sup> percentile for increasing scores) into "sub-optimal" and "poor" assessment categories. A score of 5, 3, or 1 was assigned to optimal, sub-optimal, and poor metric performance, respectively. In this way, metric values were translated into normalized metric scores, and scores for all metrics were summed to produce a total bioassessment score. Total bioassessment scores were classified according to a similar process, using the ranges and distributions of total scores for all sites studied in all years.

The purpose of constructing an index from biological attributes or metrics is to provide a means of integrating information to facilitate the determination of whether management action is needed. The nature of the action needed is not determined solely by the index score, however, but by consideration of an

analysis of the component metrics, the taxonomic composition of the assemblages, and other issues. The diagnostic functions of the metrics and taxonomic data need more study since our understanding of the interrelationships of natural environmental factors and anthropogenic disturbances is tentative. Thus, the further interpretive remarks accompanying the raw taxonomic and metric data in this summary are offered cautiously. Year-to-year comparisons depend on an assumption that specific sites were revisited in each year, and that equivalent sampling methods were utilized at each site revisit.

### **Bioassessment metrics**

An index based on the performance of 12 metrics was constructed, as described above. Table 2 lists those metrics, describes their calculation and the expected response of each to increased degradation or impairment of the wetland.

In addition to the summed scores of each metric and the associated impairment classification described above, each individual metric informs the bioassessment to some degree. The four richness metrics (Total taxa, POET, Chironomidae taxa, and Crustacea taxa + Mollusca taxa) can be interpreted to express habitat complexity as well as water quality. Complex, diverse habitats consist of variable substrates, emergent vegetation, variable water depths and other factors, and are potential features of long-established stable wetlands with minimal human disturbance. In the study conducted by Stribling et al. (1995), all four richness metrics were found to be significantly associated with water quality parameters including conductance, salinity, and total dissolved solids.

Four composition metrics (%Chironomidae, %Orthocladinae of Chironomidae, %Crustacea + %Mollusca, and %Amphipoda) measure the relative contributions of certain taxonomic groups that may have significant responses to habitat and/or water quality impacts. For example, amphipods have been demonstrated to increase in abundance in alkaline conditions. Short-lived, relatively mobile taxa such as chironomids dominate ephemeral environments; many are hemoglobin-bearers capable of tolerating de-oxygenated conditions.

Two tolerance metrics (the Hilsenhoff Biotic Index and %Dominant taxon) were included in the bioassessment battery. The HBI indicates the overall invertebrate assemblage tolerance to nutrient enrichment, warm water, and/or low dissolved oxygen conditions. The percent abundance of the dominant taxon has been demonstrated to be strongly associated with pH, conductance, salinity, total organic carbon, and total dissolved solids.

Two trophic measures (%Collector-gatherers and %Filterers) may be helpful in expressing functional integrity of the invertebrate assemblage, which can be impacted by poor water quality or habitat degradation. High proportions of filtering organisms suggest nutrient and/or organic enrichment, while abundant collectors suggest more positive functional conditions and well-developed wetland morphology. These organisms graze periphyton growing on stable surfaces such as macrophytes.

Metric scoring criteria were re-examined each year as new data was added. For 2005, all 151 records were utilized. Ranges of individual metrics, as well as median metric values remained remarkably consistent over all 5 years of analysis. Since metric value distributions changed insignificantly with the addition of the 2006 data, no changes were made to scoring criteria this year. Summary metric values and scores for the 2006 samples are given in Tables 3a-3d.

### **Quality control**

Quality control procedures for initial sample processing and subsampling involved checking sorting efficiency. These checks were conducted on 100% of the samples by independent technicians who microscopically re-examined 20% of sorted substrate from each sample. All organisms that were missed were counted and this number was added to the total number obtained in the original sort. Sorting efficiency was evaluated by applying the following calculation:

$$SE = \frac{n_1}{n_2} \times 100$$

Where: SE is the sorting efficiency, expressed as a percentage,  $n_1$  is the total number of specimens in the first sort, and  $n_2$  is the total number of specimens in the first and second sorts combined.

Quality control procedures for taxonomic determinations involved checking accuracy, precision and enumeration. Four samples were randomly selected and all organisms re-identified by independent taxonomists. A Bray-Curtis similarity statistic (Bray and Curtis 1957) was generated to evaluate identifications.
